Micro Stepping System

1

Network Based Motion Control

A maximum of 16 axis can be operated from a PC through RS-485 communications. All of the Motion conditions are set through the network and saved in Flash ROM as a parameter. Motion Library(DLL) is provided for programming under Windows 2000/XP.

2

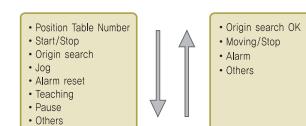

Position Table Function

Position Table can be used for motion control by digital input and output signals of host controller.

You can operate the motor directly by sending the position table number, start/stop, origin search and other digital input values from a PLC.

The PLC can monitor the In-position, origin search, moving/stop, servo ready and other digital output signals from a drive. A maximum of 256 positioning points can be set from PLC.

3

Microstep and Filtering

High precision Microstep function and Filtering (Patent pending)

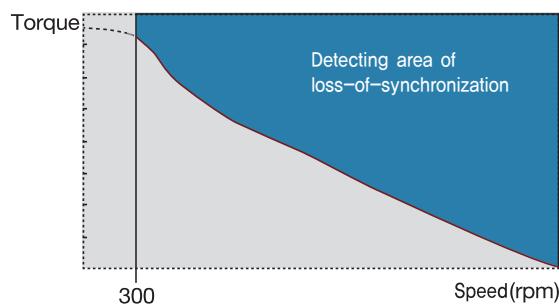

The high-performance DSP operates at step resolutions of 1.8° up to maximum 0.0072° (1/250 steps) and Ezi-STEP adjusts PWM control signal in every 25μ sec, which makes it possible for more precise current control, resulting in high-precision Microstep operation.

4**Sensorless Stall Detection**

Detecting the loss-of-synchronization with on-board DSP(Patent pending)

Ezi-STEP can detect the loss-of-synchronization of a stepping motor without the addition of an external sensor. By monitoring the voltage, current, and back-emf signal, the on-board DSP estimates the current position of a rotor and enables it to detect the loss-of-synchronization (an impossible task for a conventional stepping motor drive), this allows for high-speed operation at 100% torque rating without loss-of-synchronization*.

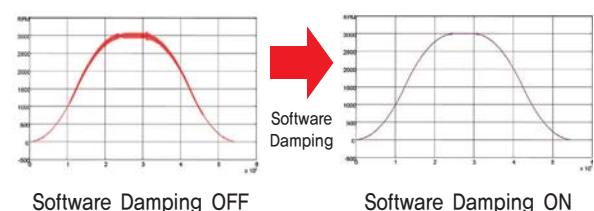

*Effective only over 300 rpm

**5****Software Damping**

Vibration suppression and high-speed operation (Patent pending)

Vibration suppression and High-speed operation (Patent pending) Motor vibration is created by magnetic flux variations of the motor, lower current from the drive due to back-emf from the motor at high speeds and lowering of phase voltages from the drive.

Ezi-STEP drive detects these problems and the DSP adjusts the phase of the current according to the pole position of the motor, drastically suppressing vibration. This allows the smooth operation of the motor at high speeds.

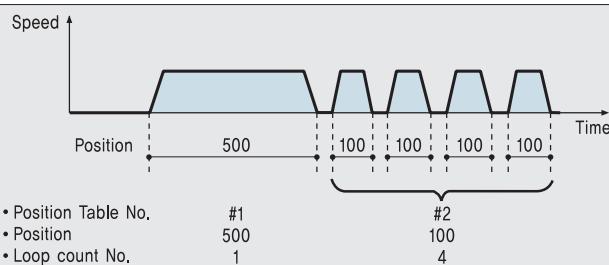

*This is real measured speed that using 100000[pulse/rev] encoder.

● Features of Motion Controller

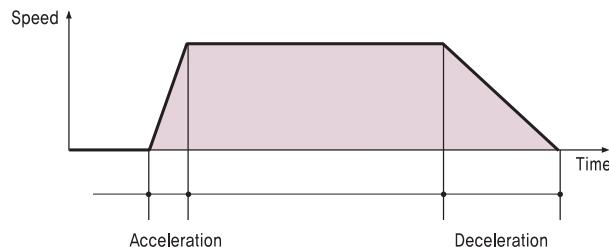

1. Loop Count

This function allows positioning repeatedly according to the Loop Count Number.

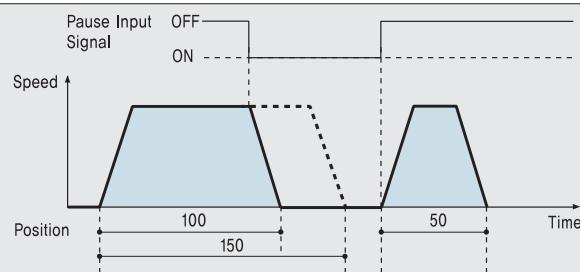

2. Acceleration/Deceleration

For quick acceleration and gradual deceleration, you can set each acceleration and deceleration time separately.

3. Pause

You can pause the motion upon the input of an external signal. When Pause signal change to OFF, the motor will restart to original target position.

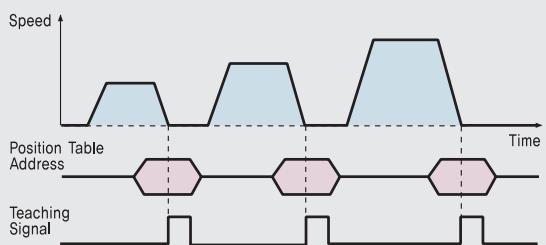

4. Alarm

The number of 7-Segment flashing time indicates which Alarm has occurred.

5. Teaching

Teaching signal is used to memorize current Position data into the selected Position Table item.

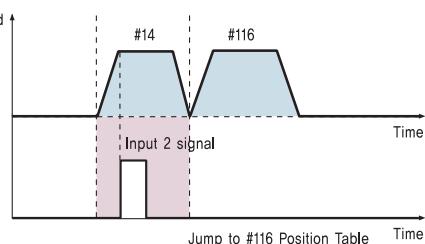

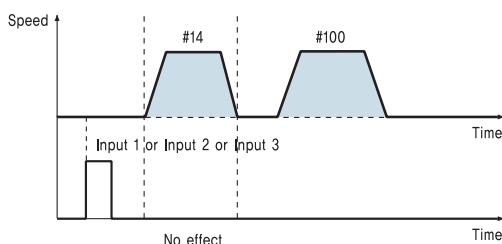

6. Jump

Within one Position Table, you can select various Position Table numbers that you want to jump. With three external input signal during movement, the next jump Position Table number can be select.

◆ Protection function and 7-Segment flash times

Times	Protection	Conditions
1	Over current error	Excessive current flowed into a motor
2	Over speed error	Motor speed exceeded 3000 rpm
3	Step out error	Abnormally motor do not followed pulsed input
5	Over temperature error	Internal temperature of a motor drive exceeded 55°C
6	Over regenerative voltage error	Back EMF more than 50V
7	Motor connect error	Power is ON without connection of motor cable to drive
9	Motor voltage error	Motor voltage is below 20V
11	System error	Error occurs in drive system
12	ROM error	Error occurs in parameter storage device(ROM)
14	Input voltage error	Power source voltage is out of limited value [20V~28V]
